# Genetic Fuzzy Systems: State of the Art and New Trends

## Outline

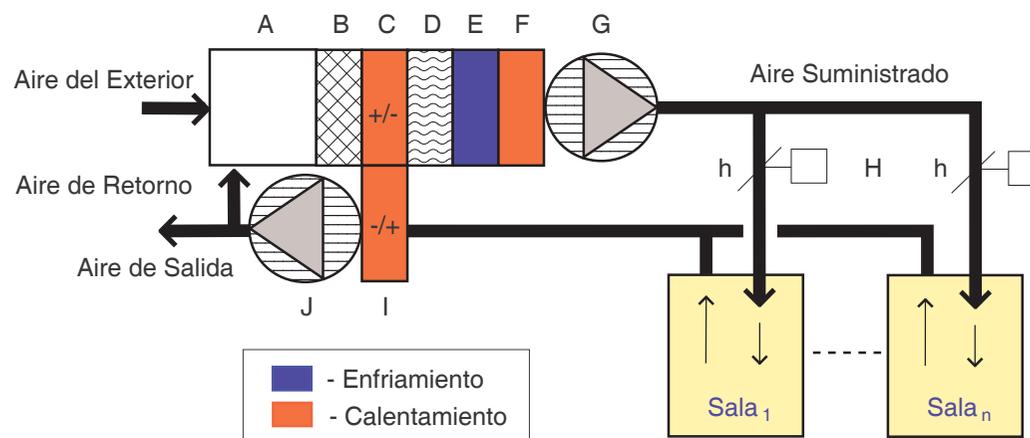

- ✓ Introduction to Genetic Fuzzy Systems
- ✓ Tuning Methods: Basic and Advanced Approaches
- ✓ Genetic Fuzzy Systems Application to HVAC Problems
- ✓ GFSs: Current Trends and Prospects
- ✓ Concluding Remarks

# GENETIC FUZZY SYSTEMS: APPLICATION TO HVAC PROBLEM

## Heating Ventilating and Air Conditioning Systems: Problem

JOULE-THERMIE JOE-CT98-0090

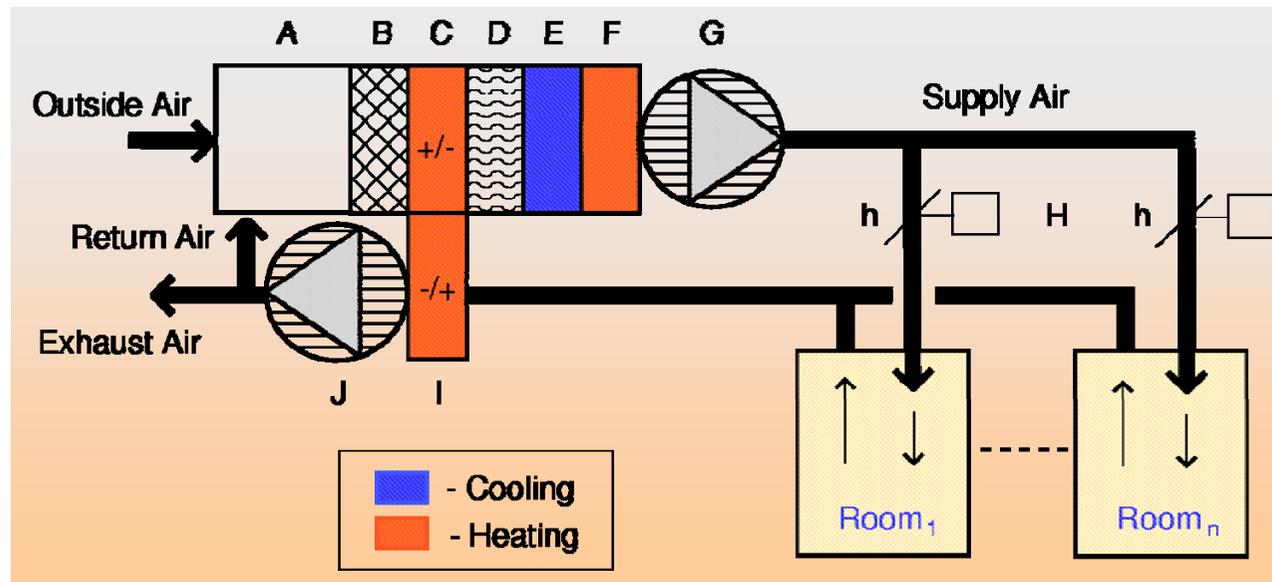

# Fuzzy Logic Controllers for Energy Efficiency Consumption in Buildings

## Heating Ventilating and Air Conditioning Systems: Problem

- Energy consumption in buildings is the 40% of the total and more than a half is for indoor climate conditions
- The use of specific technologies can save up to a 20% of the energy consumption
- The use of appropriate automatic control strategies could result in energy savings ranging 15-85 %
- Moreover, in current systems, several criteria are considered and optimized independently without a global strategy

# Fuzzy Logic Controllers for Energy Efficiency Consumption in Buildings

## Generic Structure of an Office Building HVAC System

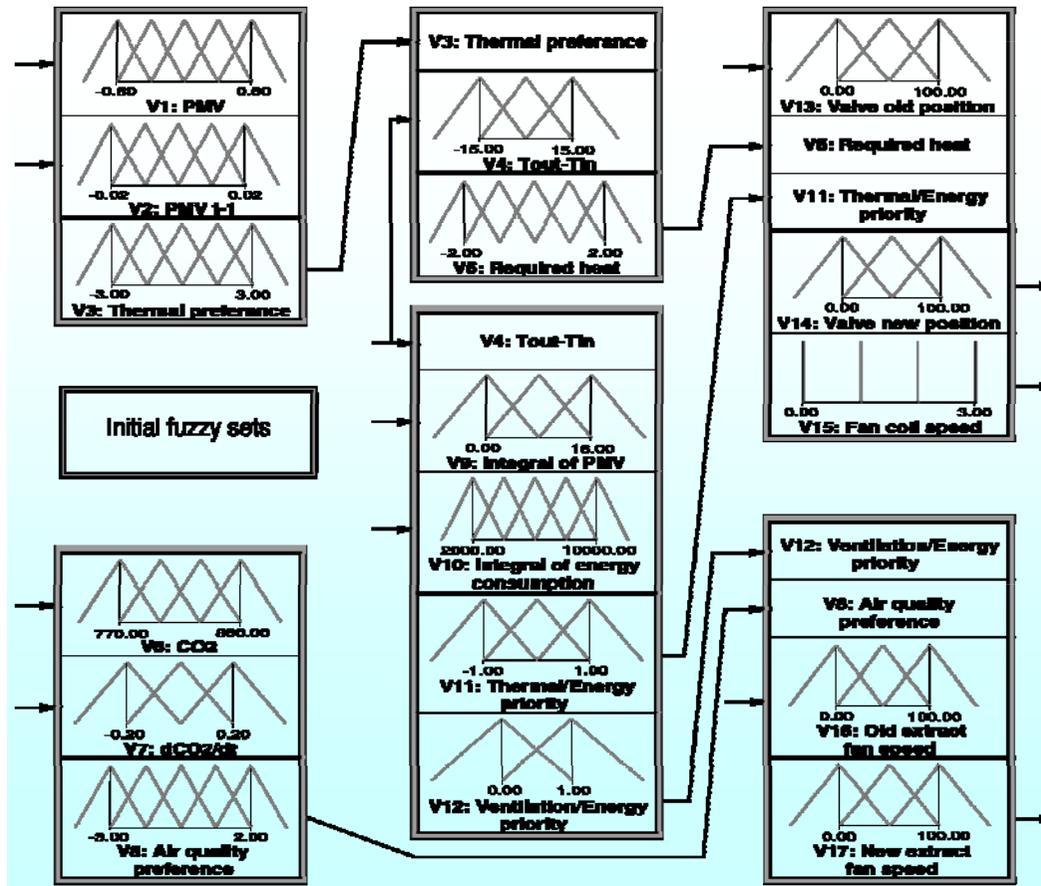

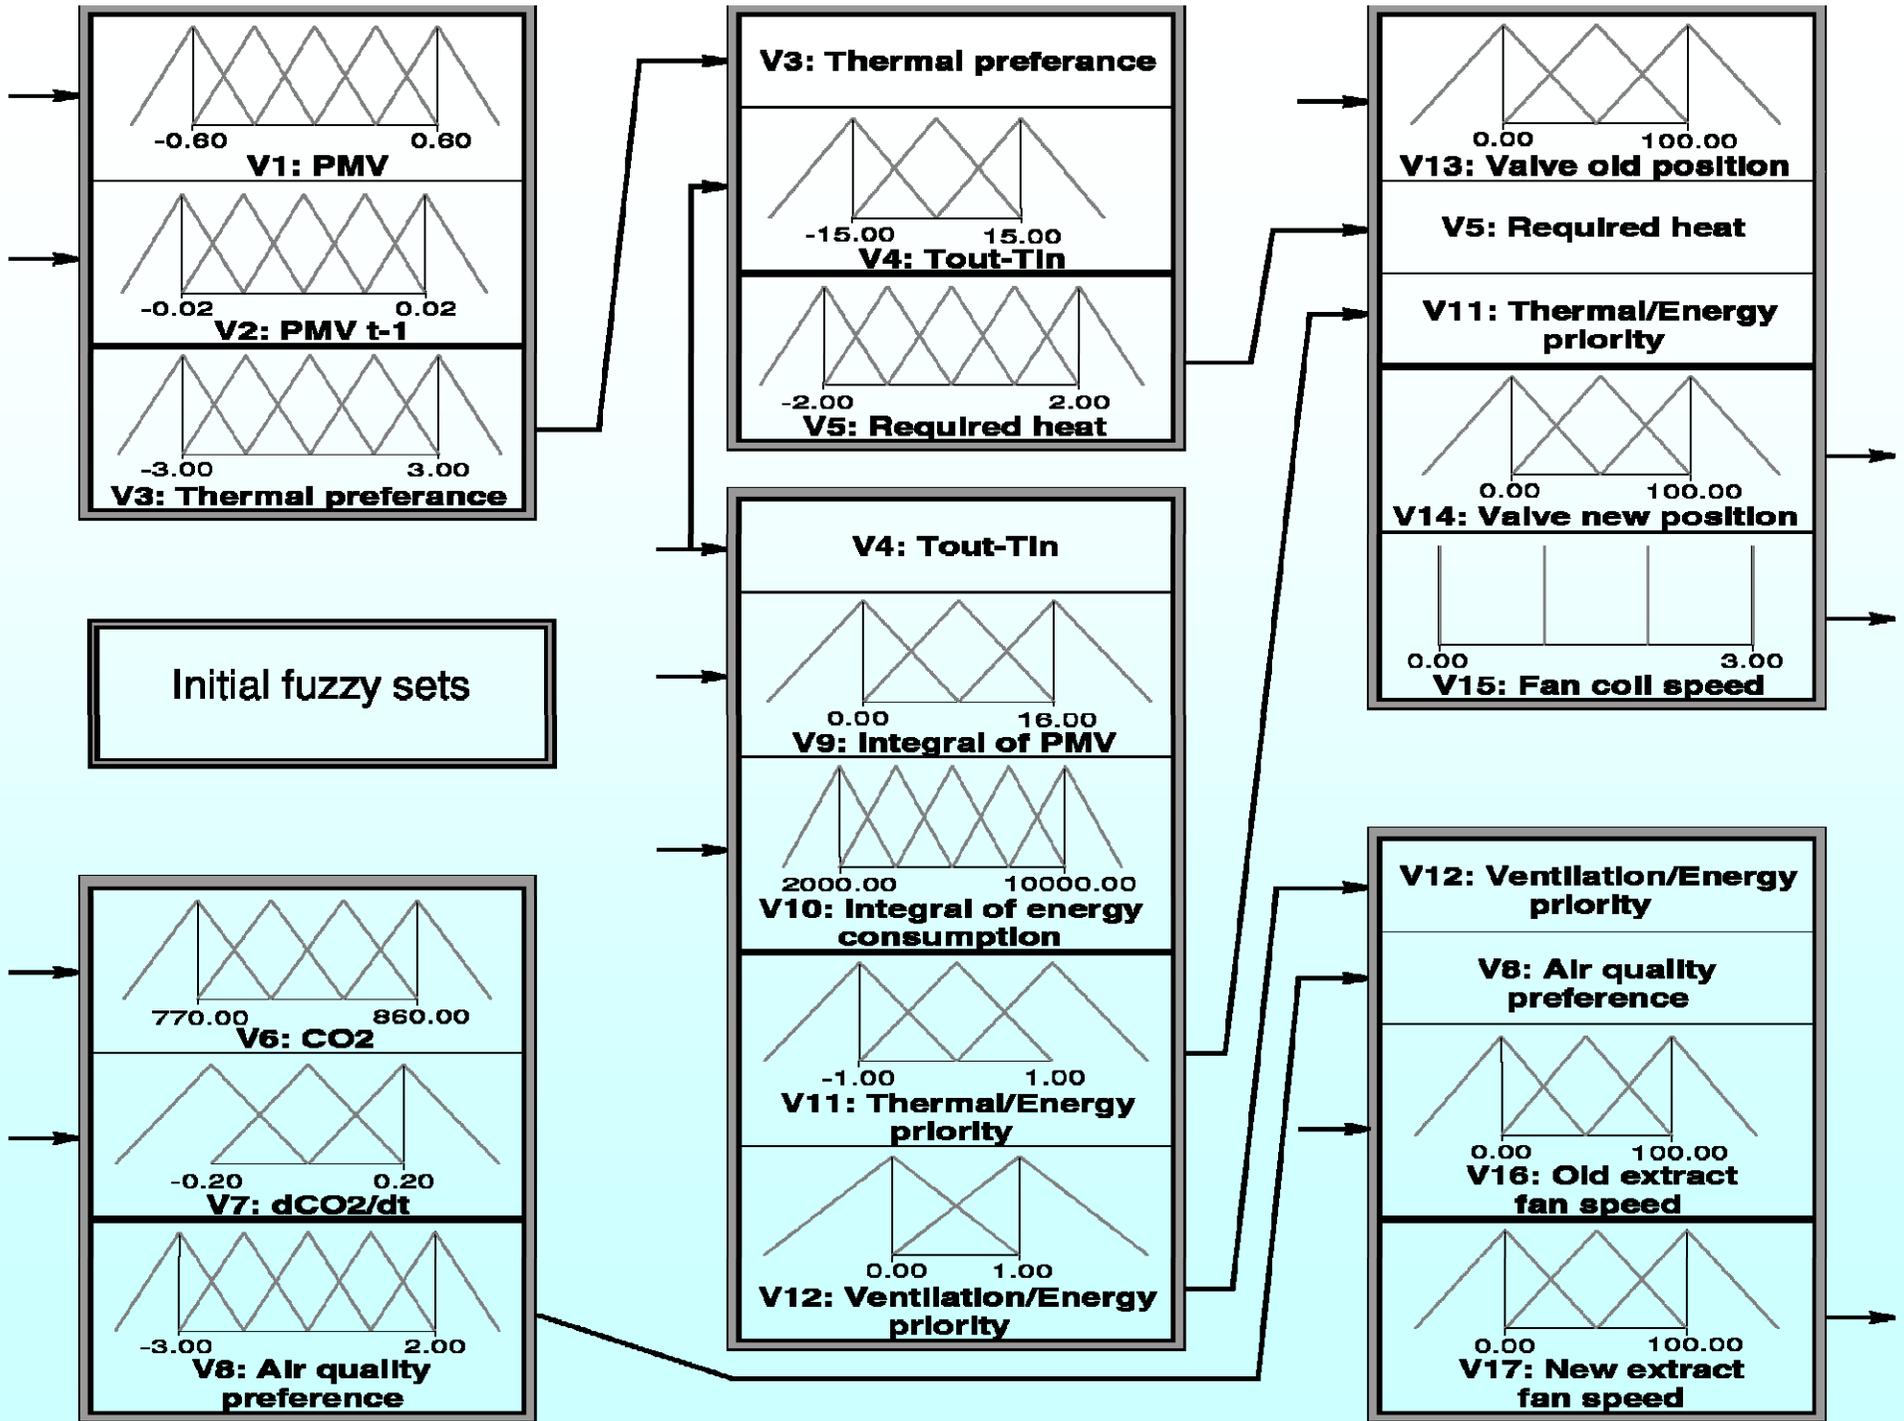

- It maintain a good thermal quality in summer and winter
- It dilutes and removes emissions from people, equipment and activities and supplies clean air

# Fuzzy Logic Controllers for Energy Efficiency Consumption in Buildings

## Initial Data Base

17 Variables

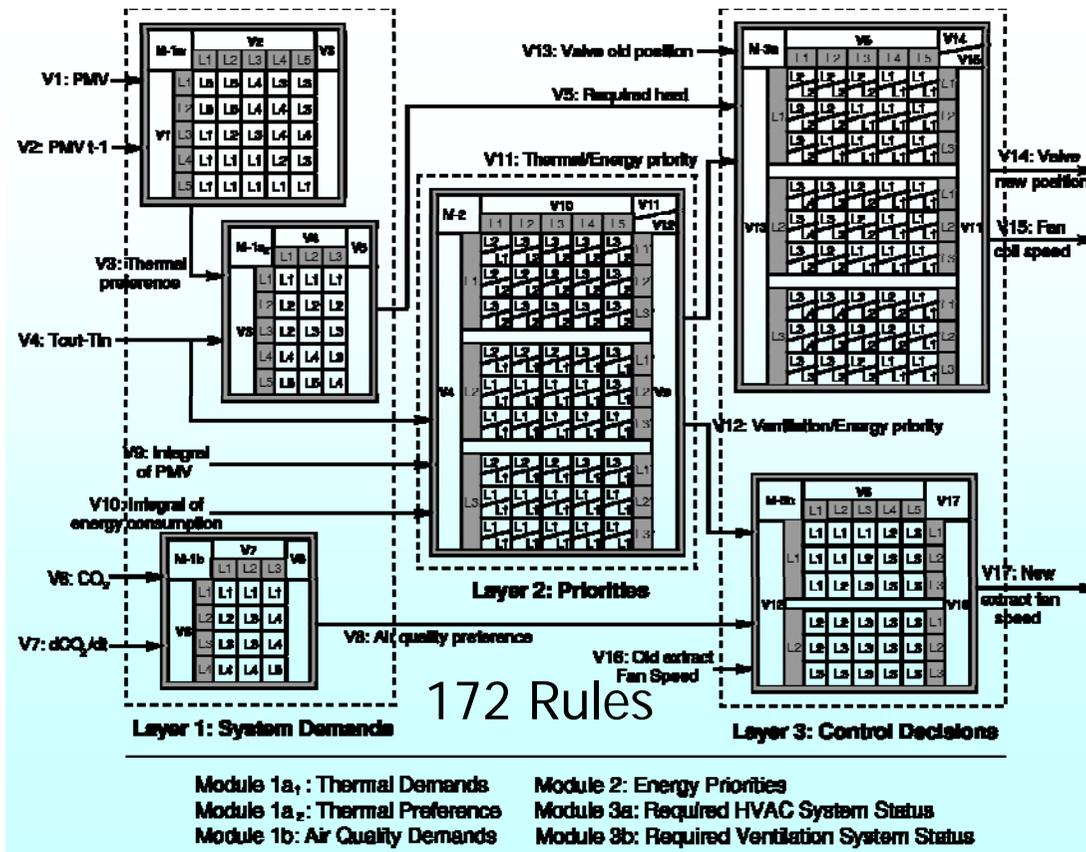

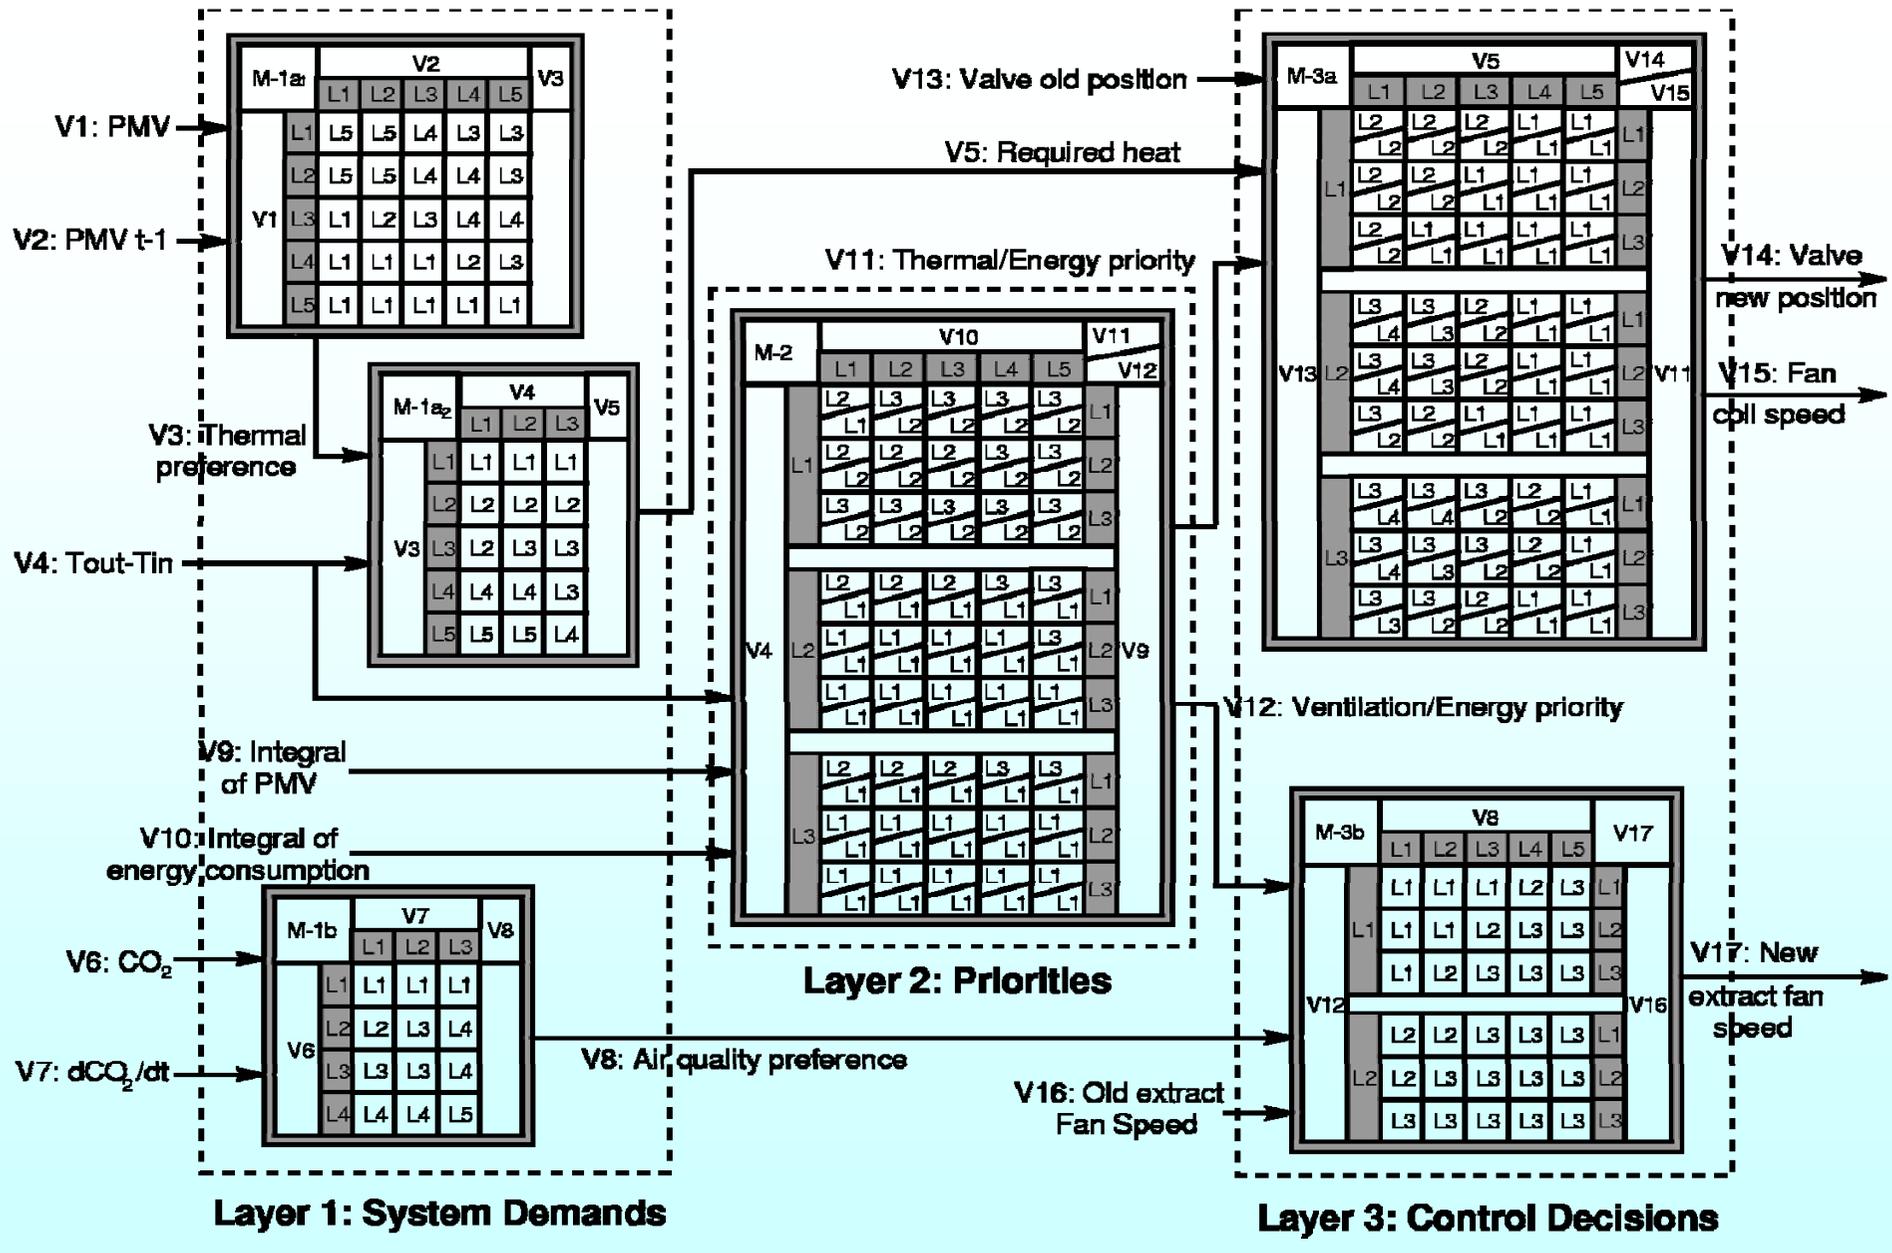

# Fuzzy Logic Controllers for Energy Efficiency Consumption in Buildings

## Initial Rule Base and FLC Structure

172 Rules

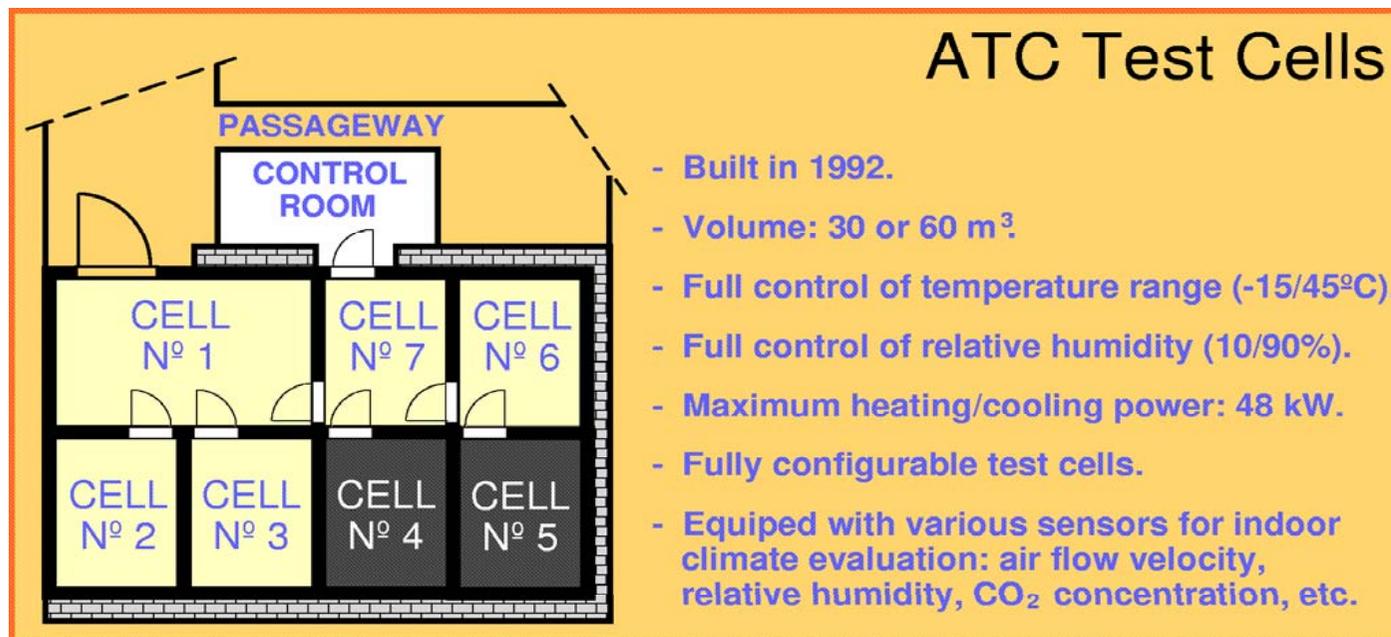

Module 1a<sub>1</sub>: Thermal Demands  
 Module 1a<sub>2</sub>: Thermal Preference  
 Module 1b: Air Quality Demands

Module 2: Energy Priorities  
 Module 3a: Required HVAC System Status  
 Module 3b: Required Ventilation System Status

# Fuzzy Logic Controllers for Energy Efficiency Consumption in Buildings

## Representation of the Test Cells

- Two adjacent twin cells were available
- A calibrated and validated model of this site was developed to evaluate each FLC

# Fuzzy Logic Controllers for Energy Efficiency Consumption in Buildings

- **Goal:** multi-criteria optimization of an expert FLC for an HVAC system: reduction of the energy consumption but maintaining the required indoor comfort levels

$O_1$  Upper thermal comfort limit <sup>3</sup>: *if*  $PMV > 0.5, O_1 = O_1 + (PMV - 0.5)$ .

$O_2$  Lower thermal comfort limit: *if*  $PMV < -0.5, O_2 = O_2 + (-PMV - 0.5)$ .

$O_3$  IAQ requirement: *if*  $CO_2 \text{ conc.} > 800ppm, O_3 = O_3 + (CO_2 - 800)$ .

$O_4$  Energy consumption:  $O_4 = O_4 + \text{Power at time } t$ .

$O_5$  System stability:  $C_5 = C_5 + \text{System change from time } t \text{ to } (t - 1)$ .

## INITIAL RESULTS

| MODELS | #R  | PMV>0.5        |  | PMV<-0.5       |  | CO <sub>2</sub> |  | ENERGY         |      | STABILITY      |        |
|--------|-----|----------------|--|----------------|--|-----------------|--|----------------|------|----------------|--------|
|        |     | O <sub>1</sub> |  | O <sub>2</sub> |  | O <sub>3</sub>  |  | O <sub>4</sub> | %    | O <sub>5</sub> | %      |
| ON-OFF | -   | 0,0            |  | 0              |  | 0               |  | 3206400        | -    | 1136           | -      |
| FLC    | 172 | 0,0            |  | 0              |  | 0               |  | 2901686        | 9,50 | 1505           | -32,48 |

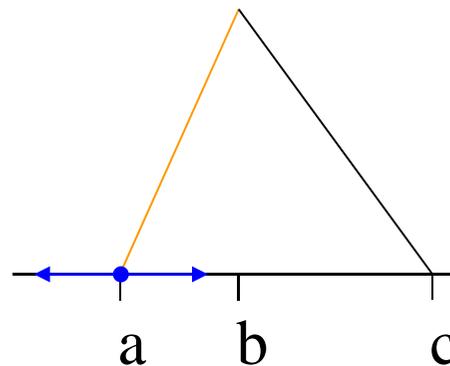

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Improving the FLC Performance

The main objective was the reduction of the energy consumption (10%), improving the stability of the controller, maintaining the required indoor comfort levels

### ■ Genetic tuning of the Data Base

- Local modification of the membership function definition points

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Objectives (to be minimized)

$O_1$  Upper thermal comfort limit <sup>3</sup>: *if*  $PMV > 0.5, O_1 = O_1 + (PMV - 0.5)$ .

$O_2$  Lower thermal comfort limit: *if*  $PMV < -0.5, O_2 = O_2 + (-PMV - 0.5)$ .

$O_3$  IAQ requirement: *if*  $CO_2 \text{ conc.} > 800ppm, O_3 = O_3 + (CO_2 - 800)$ .

$O_4$  Energy consumption:  $O_4 = O_4 + \text{Power at time } t$ .

$O_5$  System stability:  $C_5 = C_5 + \text{System change from time } t \text{ to } (t - 1)$ .

- Expert knowledge as objective weights:

$$w_1^o = w_2^o = 0.0041511 ; w_3^o = 0.0000022833$$

$$w_4^o = 0.0000017832 ; w_5^o = 0.000761667$$

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Problem Restrictions

### ■ Different-Criteria-Based Evaluation

#### ■ Multiple Criteria Algorithms:

- Multi-objective approach

- Aggregation approach

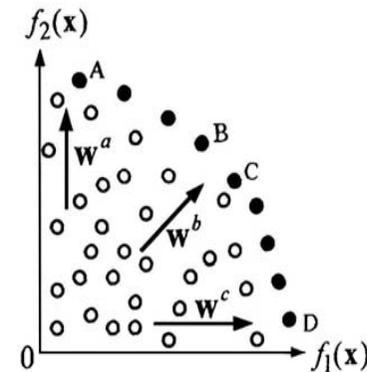

$$F(x) = w_1 \cdot f_1(x) + \dots + w_n \cdot f_n(x)$$

$$\sum w_i = 1, \quad 0 \leq w_i \leq 1, \quad i = \{1, \dots, n\}$$

Since **trusted weights** exist:

- The problem solving is easier
- Quicker algorithms can be designed

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Problem Restrictions

- The controller accuracy is assessed by means of simulations which approximately take 3-4 minutes
  - Efficient tuning methodologies:
    - Local adjustment of each tuned parameter
    - Steady-State Genetic Algorithms: quick convergence
      - 2000 evaluations  $\Rightarrow$  1 run takes approximately 4 days
    - Considering a small population (31 individuals)

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Genetic Tuning of the **Data Base**

- A **real coded** steady-state genetic algorithm for local tuning of the membership function definition points.
  - Two individuals are selected to be crossed and four descendents are obtained
  - The two best offspring are included in the population replacing the two worst individuals if they are better adapted than the latter
  - A restarting approach is considered if the population converges

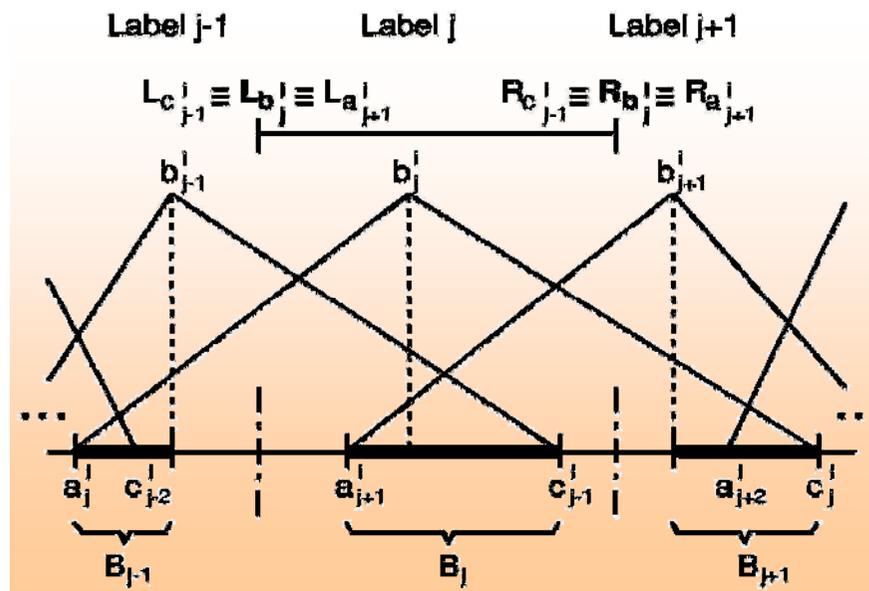

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Data Base Tuning: Algorithm (1)

- **Coding Scheme** (with  $n$  variables and  $L_i$  labels):

$$C_i = (a_1^i, b_1^i, c_1^i, \dots, a_{L_i}^i, b_{L_i}^i, c_{L_i}^i), \quad i = 1, \dots, n$$

$$C = C_1 C_2 \dots C_n$$

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Data Base Tuning: Algorithm (2)

- Genetic operators:

- The max-min-arithmetical crossover. From parents  $C^v$  and  $C^w$ , four offspring are obtained:

$$\begin{aligned} C^v &= (c_1, \dots, c_k, \dots, c_H) \\ C^w &= (c'_1, \dots, c'_k, \dots, c'_H) \end{aligned}$$

$$\begin{aligned} C^{1'} &= aC^w + (1-a)C^v \\ C^{2'} &= aC^v + (1-a)C^w \\ C^{3'} &\text{ with } c_{3k} = \min\{c_k, c'_k\} \\ C^{4'} &\text{ with } c_{4k} = \max\{c_k, c'_k\} \end{aligned}$$

- Michalewicz's non-uniform mutation.

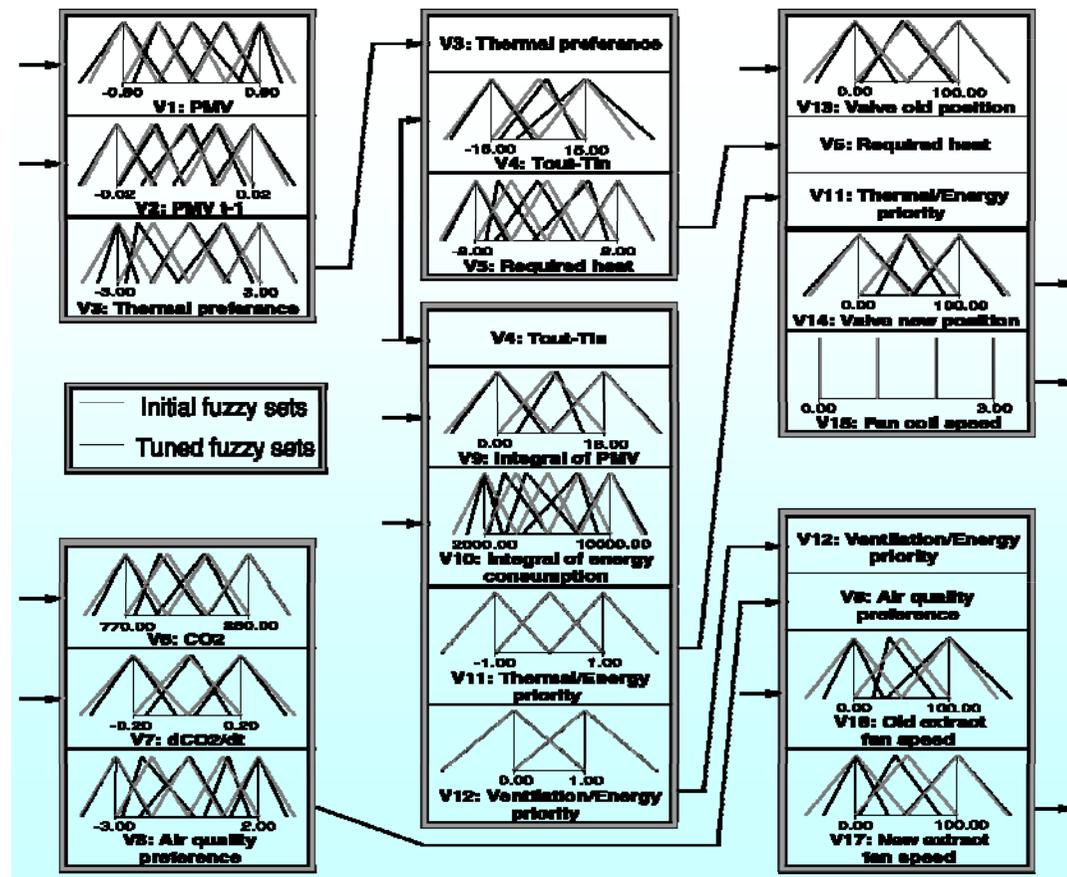

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Tuned Data Base

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Tuning

## Tuning Evolution Chart

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Rules Selection with Weights

## GENETIC RULE **WEIGHT** DERIVATION AND RULE **SELECTION**

### OBJECTIVE OF GETTING:

- a subset of rules presenting good cooperation
- the weights associated to rules

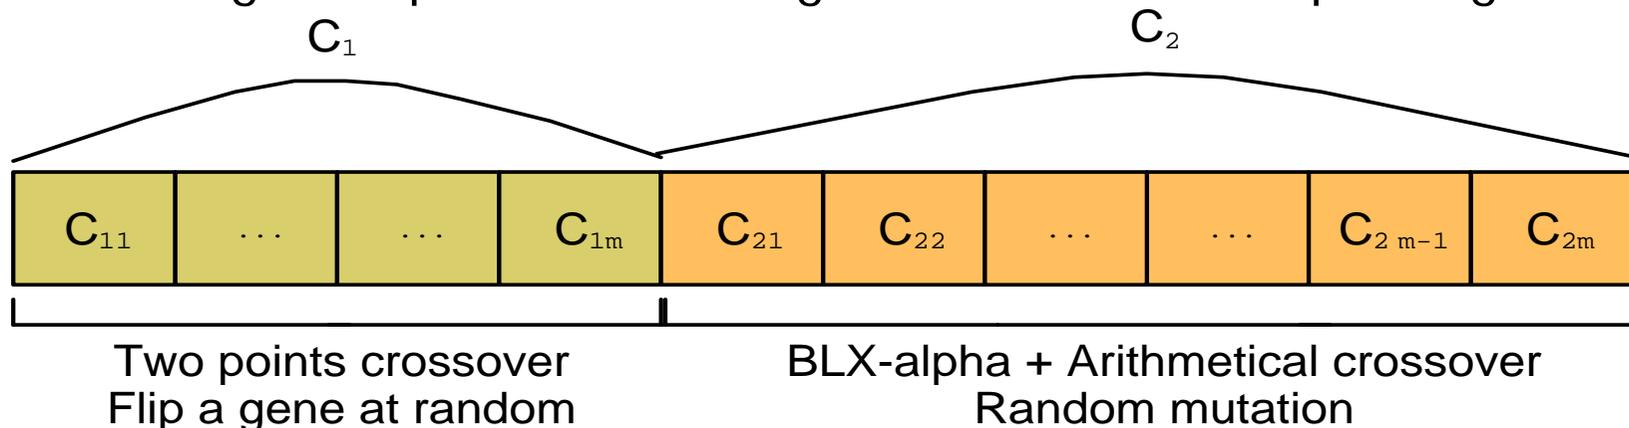

IF  $X_1$  is  $A_1$  and ... and  $X_n$  is  $A_n$  **THEM** Y is B with  $[w]$ ,  
 $w \in [0, 1]$

We use a steady-state genetic algorithm with  
a double coding scheme.

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Rules Selection with Weights

## Weight Learning: Algorithm

- A double coding scheme ( $C=C_1+C_2$ ):
  - $C_1$ : The coding scheme generates binary-coded strings of length  $m$  (number of single rules in the previously derived rule set):
  - $C_2$ : The coding scheme generates real-coded strings of length  $m$ . Each gene represents the weight used in the corresponding rule

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Rules Selection with Weights

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Lateral Tuning and Rules Selection

## Tuned Data Base (GL-S<sub>1</sub>):

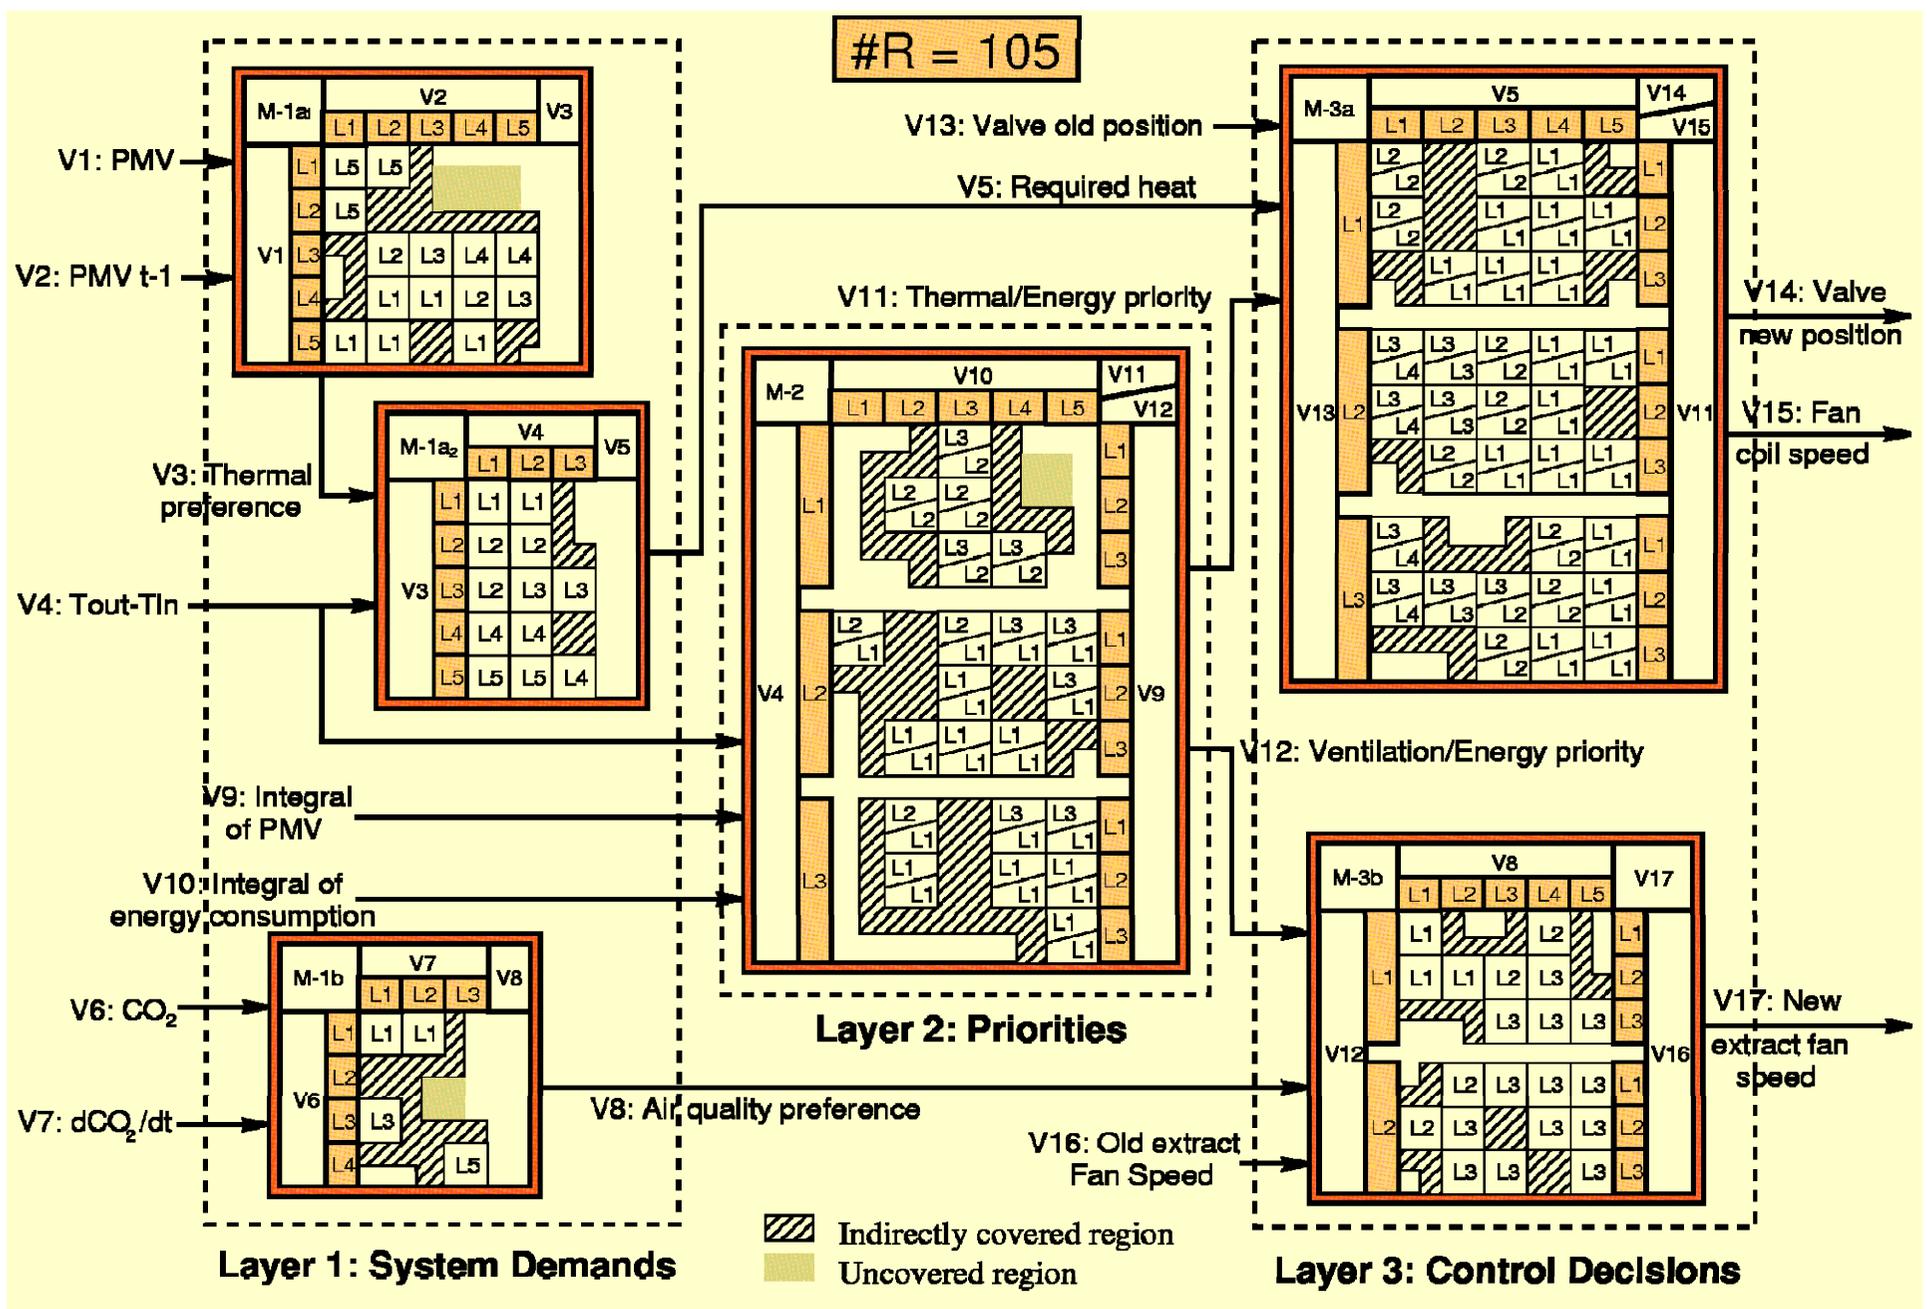

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Lateral Tuning and Rules Selection

## Selected Rule Base (GL-S<sub>1</sub>):

#R = 105

Module 1a<sub>1</sub> : Thermal Demands  
 Module 1a<sub>2</sub> : Thermal Preference  
 Module 1b : Air Quality Demands

Module 2 : Energy Priorities  
 Module 3a : Required HVAC System Status  
 Module 3b : Required Ventilation System Status

# GFS Models for Fuzzy Control of HVAC Systems: Genetic Lateral Tuning and Rules Selection

⇒ **The combination of lateral tuning (global and local) and rules selection allow us to eliminate redundant rules, tuning the parameters, and getting and high behaviour reducing the energy consumption and with good stability.**

⇒ ¿**What is the reason of the good behavior?**

**The SBRDs tuning for an HVAC system is a large scale problem with 17 variables and a lot of parameters, and the use of 1 parameter per label allows us to reduce the search space, allowing to get a better optimal local than using 3 parameters per label.**

## Outline

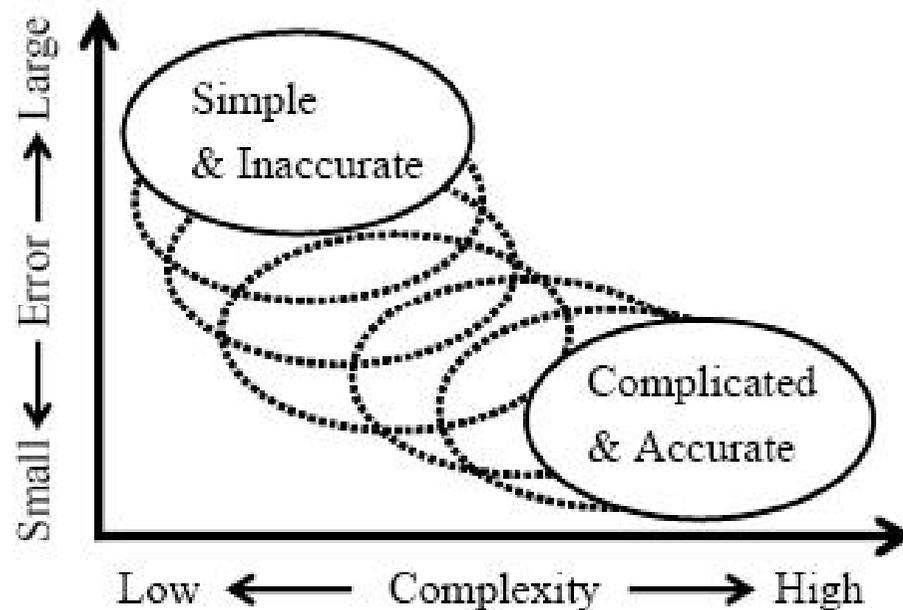

- ✓ Introduction to Genetic Fuzzy Systems
- ✓ Tuning Methods: Basic and Advanced Approaches
- ✓ Genetic Fuzzy Systems Application to HVAC Problems
- ✓ GFSs: Current Trends and Prospects
- ✓ Concluding Remarks

# Currents Trends and Prospects

- ❑ Multiobjective genetic learning of FRBSs: interpretability-precision trade-off.
- ❑ GA-based techniques for mining fuzzy association rules and novel data mining approaches.
- ❑ Genetic learning of fuzzy partitions and context adaptation.
- ❑ Learning genetic models based on low quality data (noise data and vague data).
- ❑ Genetic adaptation of inference engine components.
- ❑ Revisiting the Michigan-style GFSs.

*Classic Fuzzy Association Rule:*

If **number of children** is Low and **hours head worked last week** is Low then **head's personal income** is Low  
Factor of confidence 0.87

*Rule with 2-Tuples Fuzzy Linguistic Representation:*

If **number of children** is (Low,  $-0.16$ ) and **hours head worked last week** is (Low,  $-0.06$ ) then **head's personal income** is (Low,  $0.1$ )  
Factor of confidence 0.99

# Currents Trends and Prospects

## Formulation of the interpretability

- ❑ **Interpretability quality:** associated to the meaning of the labels and the size of the rule base

### **Interpretability considerations: semantic criteria**

Semantics: the study of meanings

- Distinguishability: Each linguistic label has semantic meaning
- Number of elements: Compatible with human capabilities
- Coverage: Any element belongs to at least one fuzzy set
- Normalization: At least one element has unitary membership
- Complementarity: For each element, the sum of memberships is one

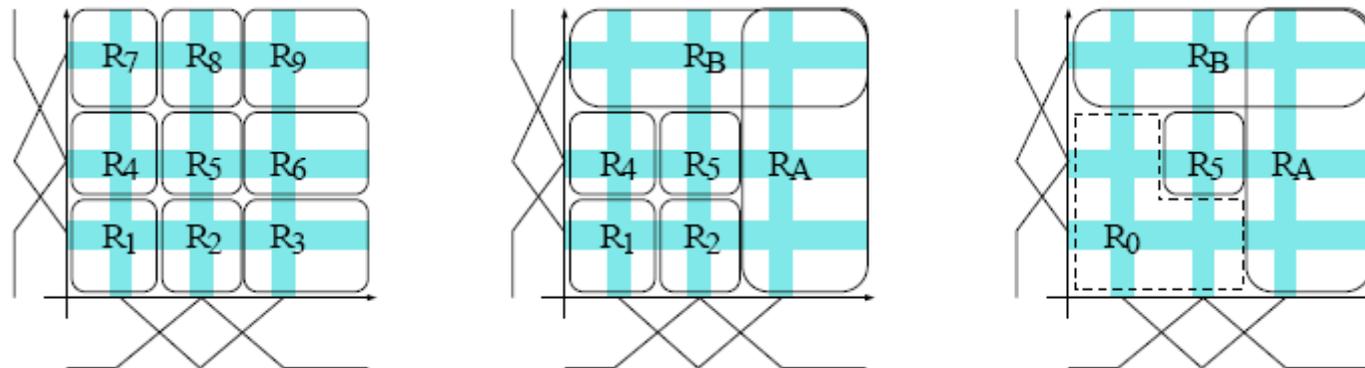

# Currents Trends and **Prospects**

- ❑ **Interpretability quality:** associated to the meaning of the labels and the size of the rule base

## **Interpretability considerations: syntactic criteria**

*Syntax: the way in which linguistic elements are put together*

- **Completeness:** for any input, at least one rule must fire
- **Rule-base simplicity:** Set of rules as small as possible
- **Rule readability:** small number of conditions in rule antecedents
- **Consistency:** rules firing simultaneously must have similar consequents

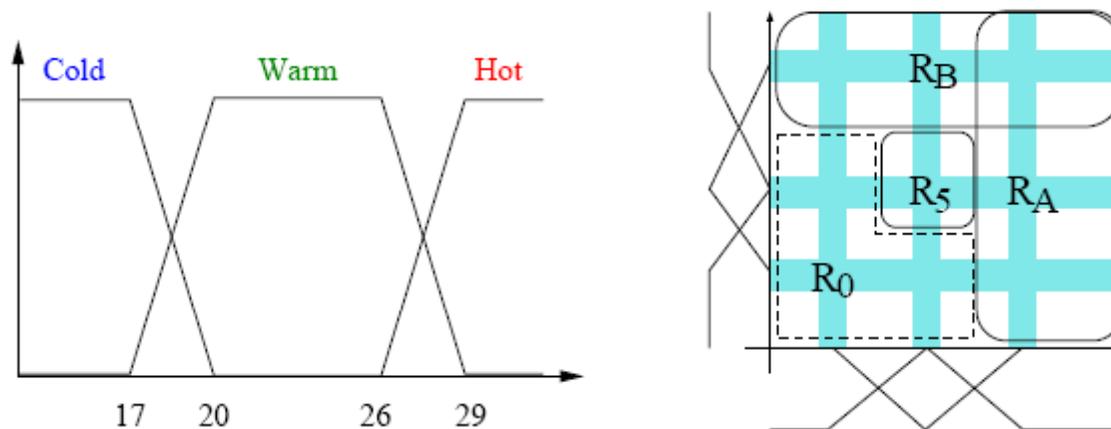

# Currents Trends and **Prospects**

- ❑ **Interpretability quality:** associated to the meaning of the labels and the size of the rule base

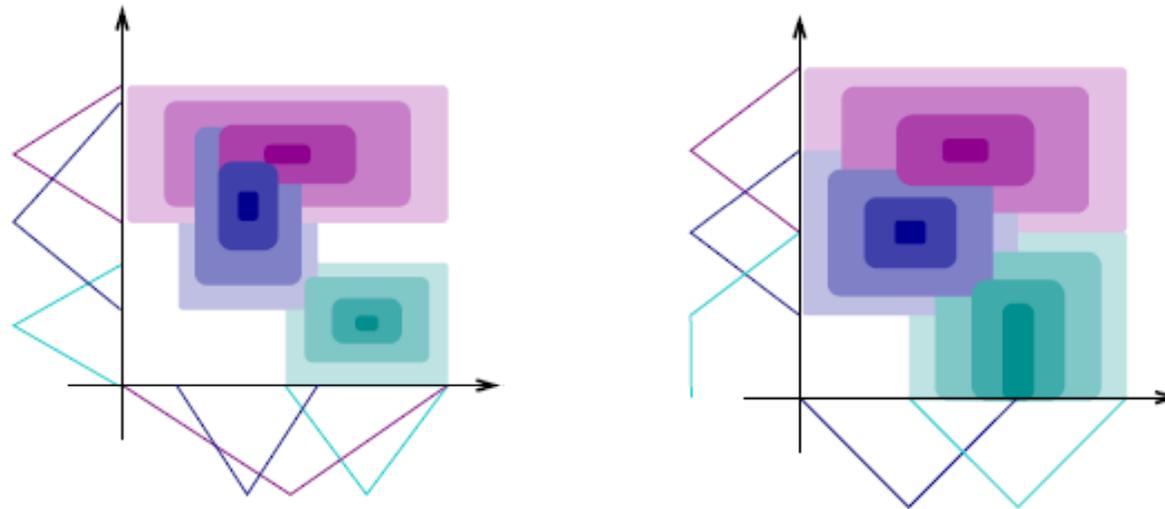

## Strategies to satisfy interpretability criteria

- Linguistic labels shared by all rules
- Normal, orthogonal membership functions
- Don't care conditions

# Currents Trends and **Prospects**

- **Interpretability quality:**

What is the most interpretable rule base?

# Currents Trends and **Prospects**

- ❑ **New data mining tasks: frequent and interesting pattern mining, mining data streams, etc**
- ❑ **Dealing with high dimensional data sets: Scalability**
  - ❑ **High number of features**
  - ❑ **High number of instances**

## Concluding Remarks

---

The hybridization between fuzzy systems and GAs in GFSs became an important research area during the last decade. GAs allow us to represent different kinds of structures, such as weights, features together with rule parameters, etc., allowing us to code multiple models of knowledge representation. This provides a wide variety of approaches where it is necessary to design specific genetic components for evolving a specific representation.

Nowadays, it is a mature research area, where researchers need to reflect in order to advance towards strengths and distinctive features of the GFSs, providing useful advances in the fuzzy systems theory.
